

UltraSeal™ - B (Bulk Rolls)

Two-piece bulk roll sleeve with separate closure for pre-insulated pipes

Product Description

UltraSeal™ - B sleeves are shipped in bulk rolls. Closures are shipped either in bulk rolls, or pre-cut. The adhesive is protected from contamination by an inner liner.

Storage & Safety Guidelines

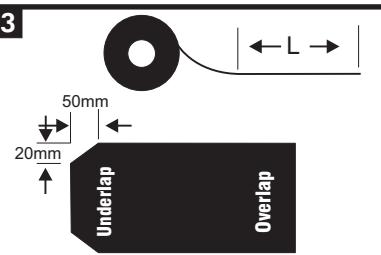

2

To ensure maximum performance, store Canusa products in a dry, ventilated area. Keep products sealed in original cartons and avoid exposure to direct sunlight, rain, snow, dust or other adverse environmental elements. Avoid prolonged storage at temperatures above 35°C (95°F) or below -20°C (-4°F). Product installation should be done in accordance with local health and safety regulations.

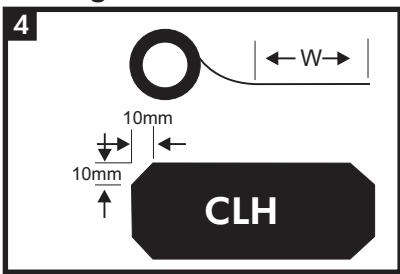

These installation instructions are intended as a guide for standard products. Consult your Canusa representative for specific projects or unique applications.

Surface Preparation

Sleeve Installation

Partially remove the release liner from the sleeve (~15 cm from the edge) and gently heat the adhesive along the underlap with a torch.

Center the closure over the overlap and press it down.

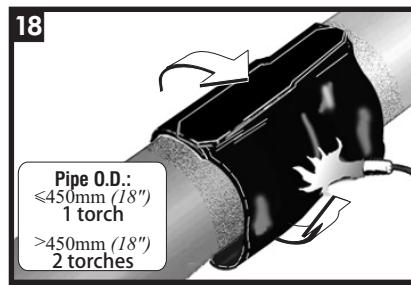

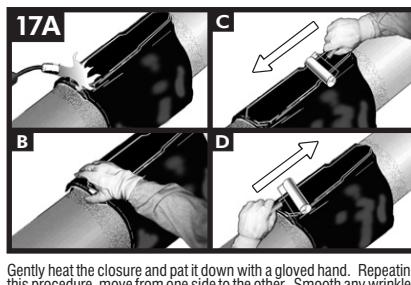

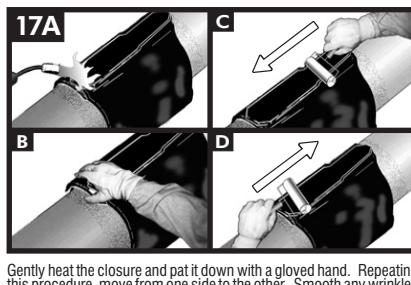

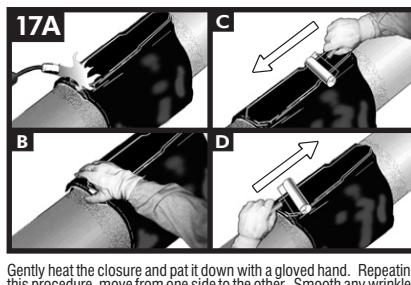

Centre the sleeve over the area to be sealed (casing pipe/PE pipe) and press the underlap into place. Remove the remaining release liner from the sleeve.

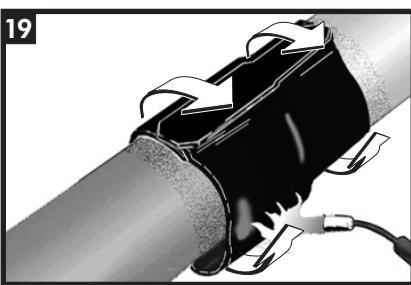

Wrap the sleeve loosely around the pipe, ensuring the appropriate overlap. Gently heat the backing of the underlap and the adhesive side of the overlap.

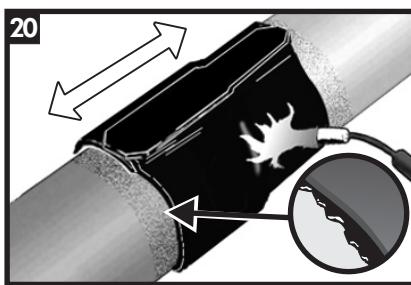

Gently heat the closure and pat it down with a gloved hand. Repeating this procedure, move from one side to the other. Smooth any wrinkles by gently working them outward from the centre of the closure with a roller.

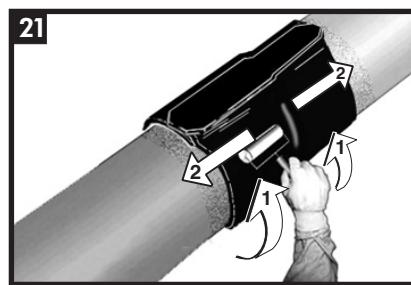

Using the appropriate torch, begin at the centre of the sleeve and heat circumferentially around the pipe. Use broad strokes. If utilizing two torches, operators should work on opposite sides of pipe.

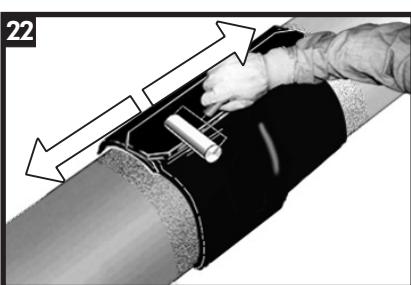

Continue heating from the centre toward one end of the sleeve until recovery is complete. In a similar manner, heat and shrink the remaining side.

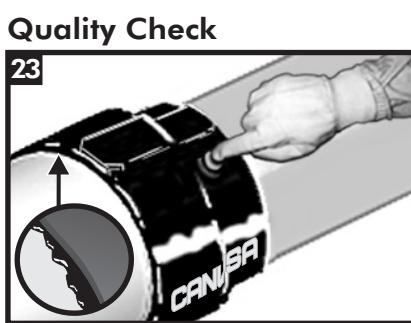

Shrinking has been completed when the adhesive begins to ooze at the sleeve edges all around the circumference and backing becomes smooth (indentations disappear). Finish shrinking the sleeve with long horizontal strokes over the entire surface to ensure a uniform bond.

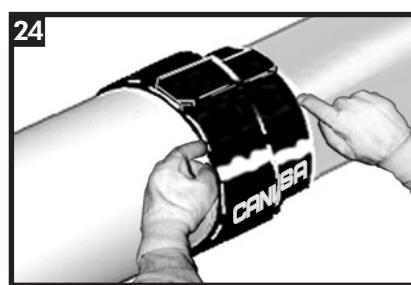

While the sleeve is still hot and soft, use a hand roller to gently roll the sleeve surface and push any trapped air up and out of the sleeve, as shown above. If necessary, reheat to roll out air.

Continue the procedure by also firmly rolling the closure with long horizontal strokes from the weld outwards.

During shrinking, press down on the sleeve to ensure adhesive flow over the entire surface. Special attention should be given along the circumference between 4 and 8 o'clock and along the overlap area. In order to avoid a channel formation at the step down, the sleeve should be pressed down. The shrinking has been completed when an adhesive ooze begins at the sleeve edges all around the circumference.

As a final check, ensure that the sleeve follows the entire contour of the surface and that there are no cold spots or burning of the sleeve. The edges of the sleeve should be sunk into the adhesive ooze and should not lift. This can be checked by feeling the edges all around the circumference of the sleeve. If there is edge lifting, the edge should be reworked with additional heat.

Recommendations

- 25** After shrinking the sleeves, they should be left for as much time as possible prior to backfill (min. 30 minutes to 1 hour, depending on ambient temperature). This ensures that the adhesive Ahas cooled enough to reach the required peel and shear strength and that permanent sealing is attained.
