

LIFE08 NAT/S/000264

# MOTH - Demonstrating an integrated North-European system for monitoring terrestrial habitats

Åsa Hagner, SLU

Field manager

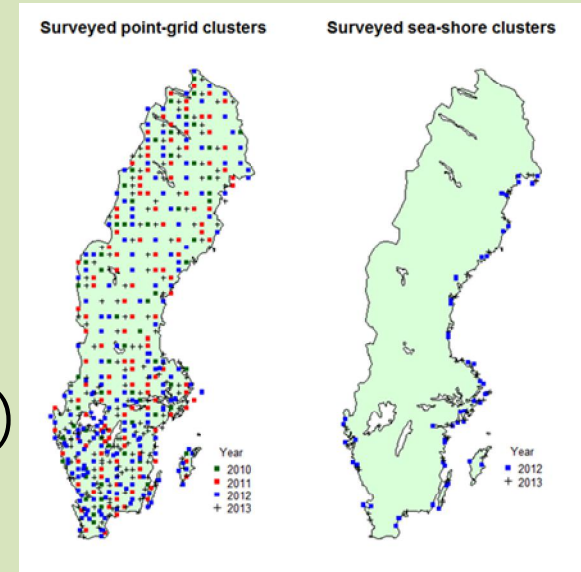

Sweden 41 000 000 ha

Coast 2 400 km (0.16%)

# Life+ MOTH (2010-2014)

- Complementary
- Random sampling
- Two phase-design: interpretation + field visit
- Estimation of areal coverage, distribution and conservation status of terrestrial (less frequent) Natura 2000 habitats
- Combining results

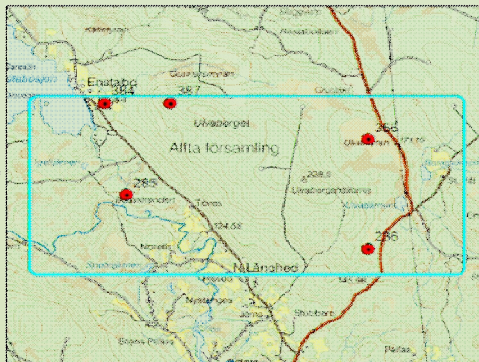

# Two-phase sampling

## MOTH General habitat inventory:

A cluster of 200 grid-points  
(5 x 2.1 km)

0 1 Kilometers

- First step: Aerial interpretation
  - Manual classification of each grid point/line-intercept using aerial infra-red images.
  - No help from ground data.
  - The aim is to divide the grid points/intercepts into broad habitat AI-classes
- Second step: Field survey
  - A proportion is randomly selected from each AI-class. The proportion differs between classes.
  - Selected plots are surveyed in the field. All plots all classified in the field and a number of status variables is measured.

- Analyses: Estimation of coverage and status .

## MOTH Seashore inventory:

Line-intercepts, of approx.  
300 lines (5 x 2,5 km)

## Before:

- Images
- Manuals
- Equipment
- Protocols
  
- Databases
- Software
  
- Principles for phase-2 selection
  
- Employing field staff

## During data collection:

### General habitat inventory:

- Phase-1: approx. 230 working days by 6-7 interpreters (dec-apr)
- Phase-2: 10 field teams, 14-16 weeks incl. training

### Seashore inventory:

- Phase-1: approx. 60 working days by 2-3 interpreters (may-june)
- Phase-2: 4 field teams, 5-6 weeks incl. training

### Support:

- Throughout the surveys (phase-1, dec-june + phase-2, may-sept)

## Afterwards:

- Data-management
- Quality-control and assessment
  
- Analyses
  
- Reporting

# Life+ MOTH General habitat inventory: Combining results

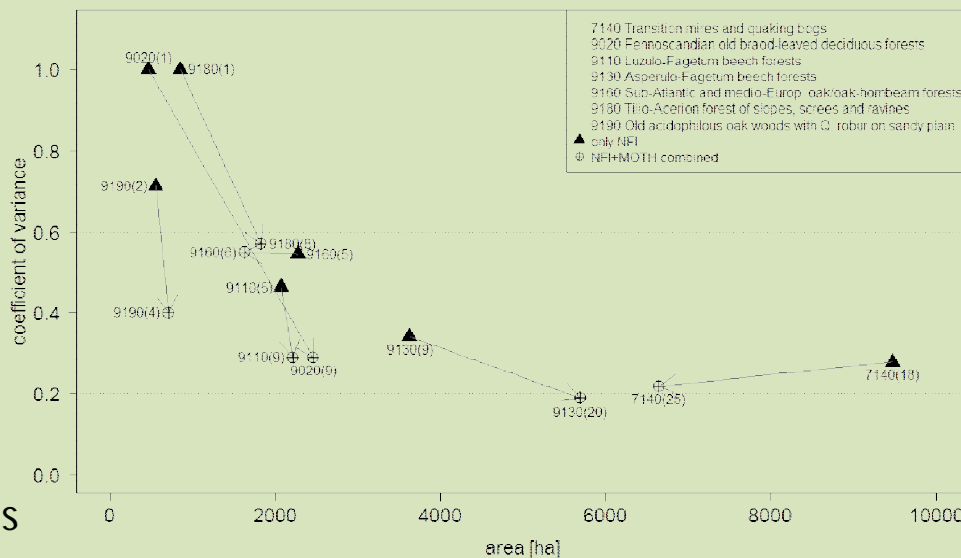

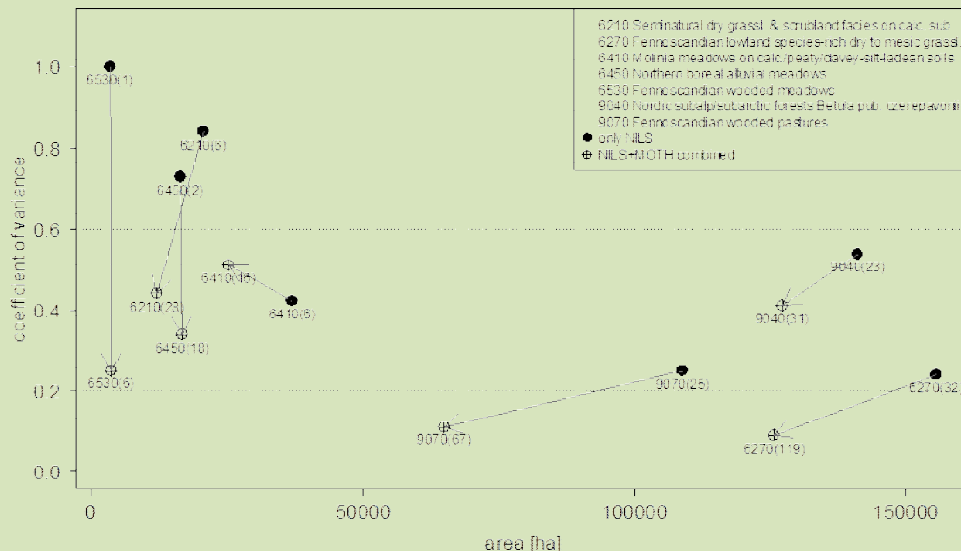

## Coverage versus accuracy of the estimation

**Boreal region:**  
Estimates based on NILS (2008-2012) versus combined estimates of NILS and MOTH (2010-2012)

**Continental region:**  
Estimates based on NFI (2008-2012) versus combined estimates of NFI and MOTH (2010-2012)

Note: different scales on x-axis

# Life+ MOTH Seashore inventory

Shore type (phase 1)	Total (km)	%	Exploited (km)	Exp. %
Rock	17 095	41,7%	1 109	6%
Boulder/gravel	11 018	26,9%	2 046	19%
Sand	3 313	8,1%	877	26%
Meadows/wetlands	6 191	15,1%	1 448	23%
Constructed*	3 357	8,2%	3 013	90%
Total Swedish seashore:	40 975 km		8 492 km	21%

\*All constructed types are "exploited"

Exploitation: according to distance to roads, houses, power-lines etc

# Life+ MOTH Seashore inventory:

Results based on 100 PSU, 6915 line-intercepts and 466 field transects:

<u>Code</u>		<u>2012 data</u>	->	<u>+2013 data</u>
	Seashore area:	63 000 ha	->	64 000 ha
1230	Veg. seacliffs	33 000 ha	->	24 200 ha
1330	Saline meadows	1 300 ha	->	1 500 ha
1630	Baltic meadows	7 800 ha	->	9 900 ha
9030	Land upheaval forests	16 100 ha	->	17 100 ha
(1640)	Sandy beaches	2 900 ha	->	3 400 ha
(2100)	Dune habitats	2 000 ha	->	4 800 ha

# LIFE+ MOTH (2010-2014)

SLU, inst. för skoglig resurshushållning:

Hans Gardfjell, projektledare

Linda Ågren, ekonomi

Åsa Hagner, fältkoordinator

Helena Forsman, flygbildstolkning koord.

Sven Adler, analytiker

Henrik Hedenås, analytiker

Monitoring Terrestrial Habitats (MOTH)  
LIFE08 NAT/S/000264

# Life+ MOTH Seashore inventory

## Selective lines:

- Approx. 300 lines per area
- Interpretation: Starting point Shore type, Coastal type, Habitat above the shore

## Selection classes:

- Combination on interpreted classes
- random sampling

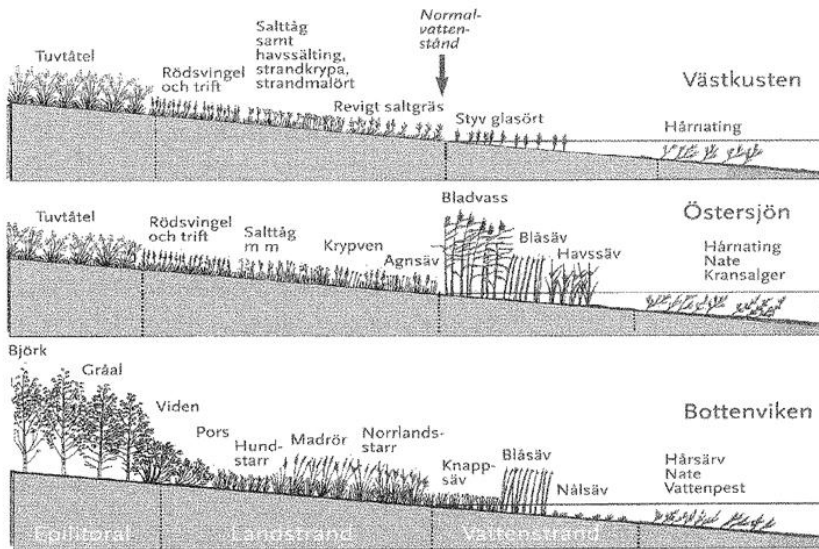

## Transects :

- 10m-wide in field
- From the mean seawater level throughout the supralitoral zone
- + connected N2k-habitat (if of interest)
- Field sampling: detailed description, habitat classification, photos

# Structures and species composition:

## Seashore meadows:

## Sandy shores:

## Rocky shores:

# Archives of images

- Photos from each site

# Life+ MOTH

- Complementary (to NFI and NILS)
- Random sampling
- Two phase-design: interpretation + field visit
  
- Combining data from MOTH with data from NFI and NILS
- Estimation of coverage, distribution and status of (less frequent) Natura 2000 habitats

## General habitat inventory:

- 565 primary sampling units á 5 x 2,1 km: 110 814 interpreted grid-points, 5976 points selected for field survey

## Seashore inventory:

- 250 primary sampling units á 5 x 2,5 km
- 5-year rotation
- 50 sampling units yearly
- 2012+2013 = 100 units: 6915 lines and 466 field transects:

# Combined assessment from different sampling designs

## Data collection in known sites

- The only(?) approach for rare habitats and species
- *Riparian mixed forest of Quercus robur (91F0, ~15 known sites in Sweden)*
- *Redlisted species*
- *Most likely biased estimates*
- *Efficient to detect a decline, but difficult to detect establishment*

## Two-phase sampling

- LIFE+ MOTH
- Useful for habitats and with low areal coverage
- *Many hard-wood forest habitats (9110, 9160 etc.)*
- *Low abundant, but habitat specific species*
- *Unbiased estimates*
- *Complicated designs*
- *Necessary to a priori define specific target habitats or species*

## Random sampling

- NFI, NILS
- Useful for abundant habitats and species
- *Coniferous old growth forests (taiga 9010), subalpine birch forests (9040)*
- *Vaccinium myrtillus*
- *Unbiased estimates*
- *Simple computations*
- *General sampling program - can most likely be adapted to future requirements*

Rare

Infrequent

Common

# MOTH Objectives

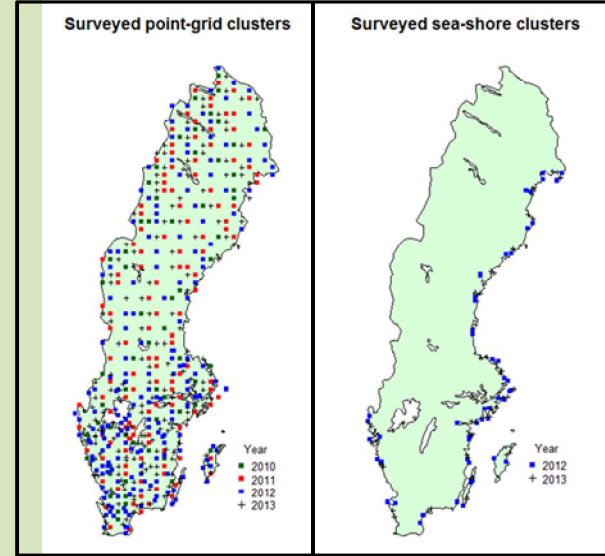

- Analyze NILS and NFI data
  - NILS - focus on alpine and grassland habitats
  - NFI - focus on forests and wetlands (mires)
- Collect and analyze data with two-phase methodology
- Develop methods for coastal habitats
- Combine MOTH data with NFI/NILS data
- Delivery of data to Species centre / Swedish EPA 2013

Ongoing Swedish monitoring programmes:

# LIFE+ MOTH

(2010-2014)

# Sources of information for Natura 2000 habitats

NFI – National Forest Inventory	NILS – National inventory of landscapes in Sweden	MOTH – monitoring of terrestrial habitats	Ängs- och betemarks-uppföljning
Forests and wetlands	All terrestrial habitat types	Collecting data for less-frequent Natura 2000 habitats.	Grasslands and grassed shoreslines
Field inventoring, Random sample	Field inventoring, Random sample	Stratified sampling: Interpretation of infra-red digital aerial images combined with field inventoring	Field inventoring, Random sample from TUVA-database
39126 terrestrial plots ( 60% permanent) 5-year interval	6455 terrestrial permanent plots 5-year interval	Approx. 10000 field plots inventoried in cooperation with NILS. 5-year interval	2544 plots. Inventoried by NILS-personnel

# Indicator species for wetlands:
