

TRAINING TURF

TRAIN HARD ON A SOFT SURFACE.

TRAINING TURF IS A SYNTHETIC TURF SOLUTION COMBINED WITH A SHOCK-ABSORBING UNDERLAYER TO ENSURE MAXIMUM COMFORT DURING EVEN THE MOST EXHAUSTING WORKOUTS. THIS SURFACE IS CREATED WITH LOW-ABRASIVE MONDOTURF FILAMENTS AND DESIGNED TO WITHSTAND EVEN THE WEAR AND TEAR OF POWER SLEDS.

INTEGRATED FOAM BACKING

An integrated under layer made of polyurethane foam mesh, which ensures the comfort and uniform elastic response of the system.

TRAINING TURF

Athletes can enhance their agility while the integrated surface markings let them easily measure their movements. Training Turf fibers make even the hardest workouts soft.

Workouts with power sleds enhance both resistance and explosiveness. But this requires a surface that enables an exerciser to control their energy—and allows only the sled to slide.

PUSH BEYOND YOUR LIMITS.

Training Turf is designed to combine softness and resistance: The shock-absorbing underlayer provides optimal support for the use of training sleds, while the surface filament construction minimizes abrasions, enabling comfortable training even when your skin touches the turf.
