valve is clean

Quick Gun Care and Trouble Shooting

The Quick Gun is designed to apply TEMP-COAT on small jobs and in tight, hard to reach places. This inexpensive, low pressure, high volume gun operates using an air compressor that can maintain 80 PSI delivered through a 3/8" air hose to the gun. TEMP-COAT is a very dry product, therefore the volume of air used to siphon the product to the gun will occasionally dry the product at the point of mixing. When that happens, remove the valve as indicated above and wash it out. Also be sure to clean out the valve when you are finished spraying.

During use and after cleaning make sure that all fittings are snug. Loose fitting will cause suction loss which impairs the gun.

If all fittings are snug, the valves are clean and the product will not pick up, it is possible that the products needs to be thinned slightly. Add 12 oz of water per 5 gl pail to achieve this purpose.
